

DEPLOYMENT GUIDE

Deploy LaunchFive Studio to Firebase

Complete browser-only deployment guide. No terminal needed. All steps, all free.

Firebase
PLATFORM

\$0 / month
COST

20-30 min
SETUP TIME

Browser Only
METHOD

What You Will Get

Your LaunchFive Studio website hosted on Firebase for free, accessible worldwide, with HTTPS and custom domain support.

10GB

HOSTING

5GB

FILE STORAGE

2M

FUNCTIONS/MO

Free

SSL CERT

Complete Free Tier Cost Summary

SERVICE	FREE TIER	COST
Firebase Hosting	10GB storage, 360MB/day transfer	\$0
Firestore Database	1GB stored, 50K reads/day	\$0
Firebase Auth	Unlimited users, 10 providers	\$0
Firebase Storage	5GB stored, 1GB/day download	\$0
Cloud Functions	2M invocations/month	\$0
Firebase Analytics	Unlimited events	\$0
Resend (Emails)	3,000 emails/month	\$0
Custom Domain	~\$10-15/year (optional)	~\$1/mo

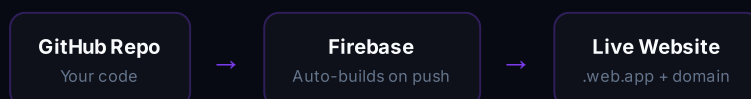

Total Monthly Cost: \$0

Everything above is completely free. The only optional cost is a custom domain name (~\$10-15/year).

Your Live URLs After Deployment

URL	PURPOSE
<code>launchfive-studio.web.app</code>	Primary website (auto-generated)
<code>launchfive-studio.firebaseio.com</code>	Alternative URL (auto-generated)
<code>launchfive.studio</code>	Custom domain (after Phase 6)

Deployment Flow

PHASE 1

Push Code to GitHub

Upload your project files to a GitHub repository that connects to Firebase.

1 Create a GitHub Repository

Go to github.com/new and create a new repository:

- ☐ **Repository name:** `launchfive-studio`
- ☐ **Description:** LaunchFive Studio - Freelancer Team Portfolio Website
- ☐ **Visibility:** Public (required for free Firebase auto-deploy)

Click "**Create repository**" and leave this tab open for Step 3.

2 Download Your Project Files

From the Z.AI workspace, download the entire project folder as a ZIP archive to your computer. Extract the ZIP to a local folder.

3 Upload Code to GitHub

On your new GitHub repo page, click "**uploading an existing file**". Drag and drop ALL project files from the extracted folder. Add commit message: `Initial commit`. Click "**Commit changes**".

Easier Alternative

Install **GitHub Desktop** (desktop.github.com) to drag-and-drop files. Clone the repo, paste files, click Push.

PHASE 2

Create Firebase Project

Set up your Firebase project in the Google Cloud console.

4 Open Firebase Console

Go to console.firebase.google.com in your browser. Sign in with your Google account (any Gmail works).

5

Create a New Project

Click **"Create a project"**. Fill in:

- ☐ **Project name:** `launchfive-studio`
- ☐ **Project ID:** Auto-generates as `launchfive-studio` (note this down)
- ☐ **Google Analytics:** Enable (recommended for visitor tracking)
- ☐ **Analytics account:** Select Default or create new

Click **"Create project"**. Wait ~30 seconds, then click **"Continue"**.

PHASE 3

Set Up Firebase Hosting

Connect your GitHub repository to Firebase for automatic deployment.

6 Navigate to Hosting

In your Firebase project console, click **"Build"** in the left sidebar, then click **"Hosting"**. Click **"Get started"**.

7 Connect GitHub Repository

Look for **"Connect to GitHub"** or go to the **"Deploy"** tab. Click **"Connect to GitHub"**. Authorize Firebase to access your GitHub. Select the repository: `launchfive-studio`. Click **"Connect"**.

PHASE 4

Configure Build Settings

Tell Firebase how to build your Next.js project.

8 Set Up Auto-Deploy Configuration

In the Firebase Hosting settings, fill in the build configuration fields:

FIELD	VALUE
Branch	<code>main</code>
Build command	<code>npm run build</code>
Output directory	<code>out</code>
Install command	<code>npm install</code>

Check **"Automatically re-deploy on push"** and click **"Save"**.

9 Edit next.config.ts for Static Export

Go to your GitHub repo, open `next.config.ts`, click the pencil icon to edit. Replace the entire file with:

```
import type { NextConfig } from "next"; const nextConfig: NextConfig = { output: "export", images: { unoptimized: true }, typescript: { ignoreBuildErrors: true }, reactStrictMode: false, }; export default nextConfig;
```

Click **"Commit changes"** with message: `Configure for Firebase static export`.

10 Add .nojekyll File

In your GitHub repo root, click **"Add file"** then **"Create new file"**. Name it `public/.nojekyll`. Leave content empty. Click **"Commit new file"**.

Why .nojekyll?

This prevents Firebase from ignoring files starting with underscore (like `_next/`), ensuring all assets load correctly.

PHASE 5

Deploy Your Website!

Firebase will automatically build and deploy your site after detecting the code push.

11 Trigger the Deploy

After committing the `next.config.ts` change in Step 9, Firebase auto-detects the push and starts building. Go to **Firebase Console** → **Hosting**. You should see a build in progress under "Deploy history". Wait 2-3 minutes for the build to complete. Once done, you will see: **Deploy successful!**

Your site is now LIVE!

<https://launchfive-studio.web.app>

Click the URL to see your live website

PHASE 6

Connect Custom Domain

Add your own professional domain name with free HTTPS.

12 Add Custom Domain in Firebase

In Firebase Console, go to **Hosting** and click "Add custom domain". Enter your domain (e.g., `launchfive.studio`). Optionally check "Redirect to www". Click "Continue".

13 Update DNS Records at Your Registrar

Firebase will display DNS records to add. Go to your domain registrar (Namecheap, GoDaddy, etc.) and add:

TYPE	NAME	VALUE
TXT	@	google-site-verification=XXXXX (from Firebase)
A	@	199.36.158.100
A	@	199.36.158.101
A	@	199.36.158.102
A	@	199.36.158.103

Go back to Firebase and click "Finish". DNS propagation takes 1-24 hours. Firebase auto-provisions a **free SSL certificate** via Let's Encrypt.

IMPORTANT

Static Export Limitations

Firebase Hosting serves static files. Here is what works and what needs adjustment.

FEATURE	STATUS	NOTES
All pages and sections	Works	Hero, Services, Team, Portfolio, Contact, Footer
Framer Motion animations	Works	All client-side animations render correctly
3D Hero Scene	Works	Three.js renders client-side via WebGL
Responsive / Mobile layout	Works	All Tailwind CSS breakpoints active
Dark theme + glassmorphism	Works	CSS backdrop-filter, gradients all work
/api/contact route	No	Static export has no server for API routes
Contact form submissions	Needs fix	Use Firestore directly from the client (see below)

Fix Contact Form with Firestore (Phase 2)

Replace the server API route with Firestore written directly from the browser. No backend needed.

A Create Firestore Database

Go to Firebase Console → **Build** → **Firestore Database** → **Create database**. Choose **"Start in test mode"**. Select location: `asia-south1`. Click **"Create"**.

B Get Your Firebase Config

Go to Firebase Console → **gear icon** → **Project Settings** → **General** → **Your apps** → **Web app** → **Config**. Copy the `firebaseConfig` object.

C Update Contact Form Component

Install `firebase` package and update the contact form to write directly to Firestore. Form data will be saved to a `contacts` collection, visible in Firebase Console.

```
import { initializeApp } from "firebase/app"; import { getFirestore, collection, addDoc } from "firebase/firestore"; // Paste your config from Firebase Console const app = initializeApp({ apiKey: "YOUR_KEY", ... }); const db = getFirestore(app); // In your form submit handler: await addDoc(collection(db, "contacts"), { name, email, phone, company, service, budget, timeline, description, referenceLink, createdAt: new Date().toISOString(), });
```

QUICK REFERENCE

All Steps at a Glance

Print this page and check off each step as you complete it.

#	WHERE	ACTION	DONE
1	github.com	Create repository: <code>launchfive-studio</code>	☐
2	Local	Download project ZIP from Z.AI workspace	☐
3	github.com	Upload all project files to repository	☐
4	Firebase	Open <code>console.firebase.google.com</code>	☐
5	Firebase	Create project: <code>launchfive-studio</code>	☐
6	Firebase	Click "Get started" in Hosting section	☐
7	Firebase	Connect GitHub, select repository	☐
8	Firebase	Set build config (branch, build cmd, output dir)	☐
9	github.com	Edit <code>next.config.ts</code> : output to "export"	☐
10	github.com	Add <code>public/.nojekyll</code> empty file	☐
11	Firebase	Wait for auto-deploy to complete (2-3 min)	☐
12	Firebase	Add custom domain (optional)	☐
13	Registrar	Add DNS A + TXT records from Firebase	☐

Recommended Domain Registrars

REGISTRAR	URL	PRICE	BEST FOR
Google Domains	domains.google	~\$12/yr	Seamless Firebase integration
Namecheap	namecheap.com	~\$10/yr	Affordable, good DNS management
Cloudflare	cloudflare.com	At-cost	Fast DNS propagation

Top Pick

Domain: `launchfive.studio` (~\$10-15/year) - perfectly brand-aligned and professional.

Future Enhancements (After Deployment)

FEATURE	FIREBASE SERVICE	COST
Client portal (login)	Firebase Authentication	Free
Portfolio image uploads	Firebase Storage	Free
Real-time notifications	Cloud Messaging	Free
Visitor analytics	Firebase Analytics	Free
Contact form emails	Cloud Functions + Resend	Free
Project management DB	Firestore	Free

You Are All Set!

Follow the 13 steps above and your LaunchFive Studio website will be live on Firebase at zero cost. Every future push to GitHub will automatically trigger a new deployment.
